

Closure Plan for Class V Injection Well – Large Capacity Cesspool

Location: Macomb Reservation State Park, 201 Campsite Road, Schuyler Falls, NY 12985

Background & Intent: It is the intent to close the existing cesspool/seepage pits under buildings #2, #7, and #8 (see attached Map). EPA/DEC is requiring us to close the cesspool/seepage pits for each facility listed above. The seepage pits are required to be excavated out and the materials are required to be disposed of as “special waste”. Due to the close proximity and the depth of the seepage pits to the buildings, the buildings would be undermined with the removal of the pits. Resultantly we will have to be demolished the buildings and remove the seepage pits and the waste.

The Class V Injection well is defined as a Large Capacity Cesspool according to EPA definition.

Buildings that the Cesspools serviced have been closed for approximately 5 years. The fluids that entered the Class V well previously were untreated sanitary waste containing human excreta.

There is no future requirement for waste disposal as the buildings that the cesspools service will be demolished as part of the closure action. All drains will be removed as part of the demolition.

All waste/contaminated soils will be removed from in and around the cesspool until clean soil is reached. Disposal of the waste will follow the requirements of 6 NYCRR Part 360.

The waste in question is 100% solid as the sites have not been in use for many years thus no dewatering will be necessary. Onsite storage will be in tarp covered roll off containers until disposal.

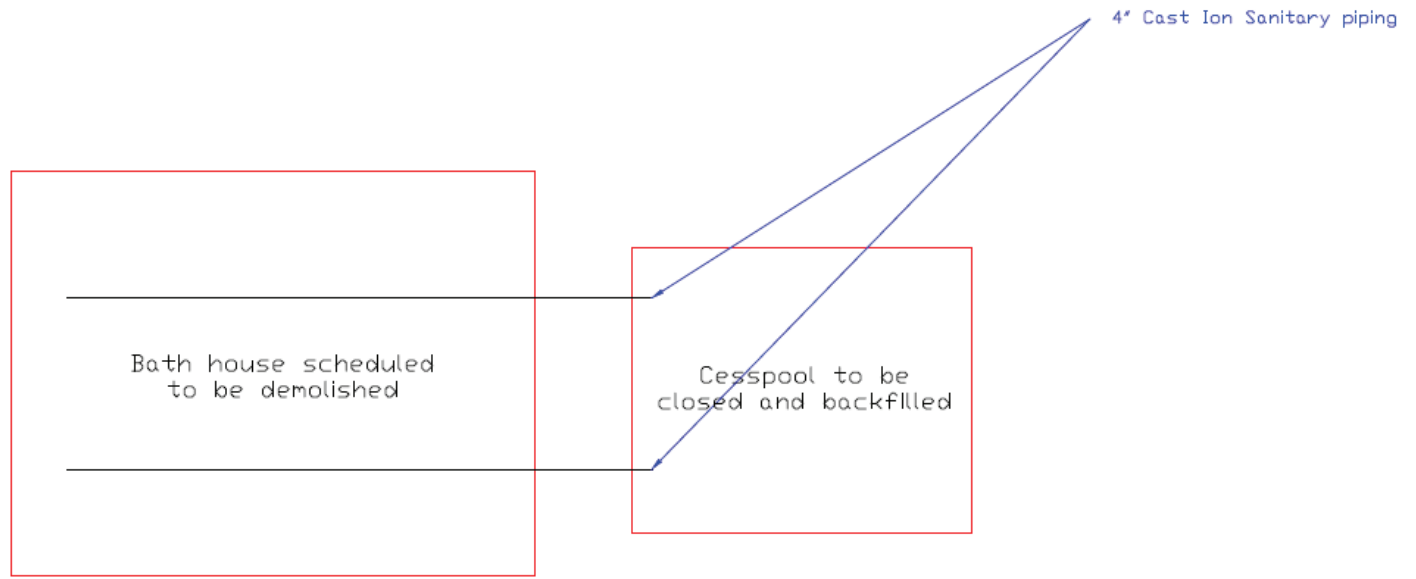

Characterization of the waste is not necessary as the cesspool received sanitary waste only.

Sites will be backfilled with clean inert Sand.

A final outlining the closure procedures, and including all initial and end-point analyses results and waste disposal manifests shall be submitted to:
